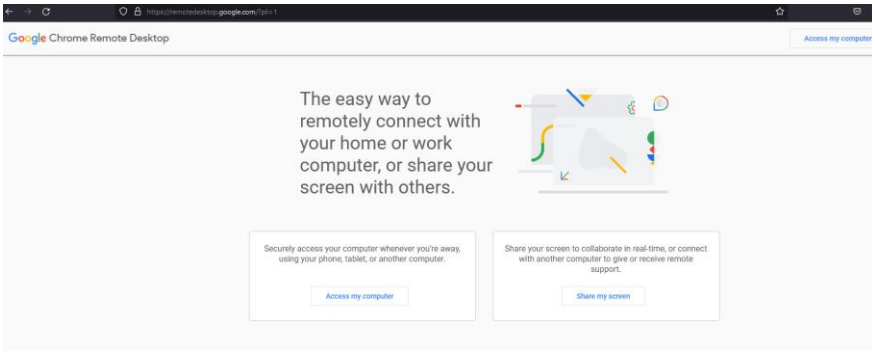
How to Install Chrome Remote Desktop

Google is makes life simpler for users around the world with the Chrome Remote Desktop.

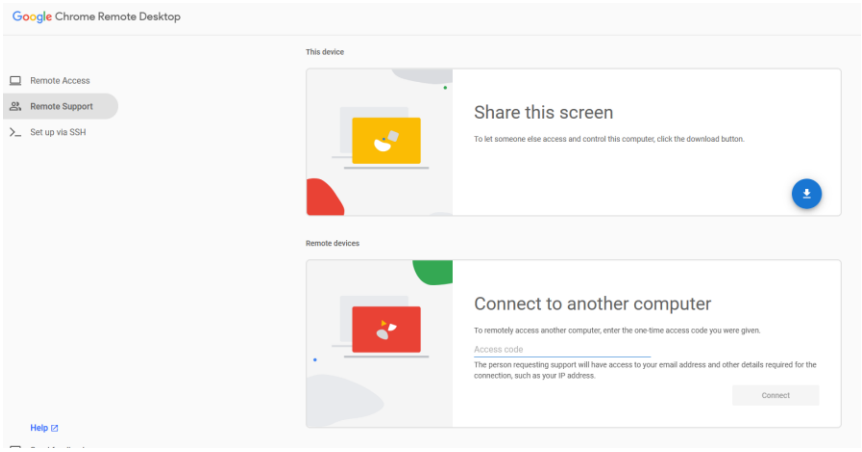
With the Chrome Remote Desktop extension, you are able to access other computers remotely and securely, which is great when needing to provide technical support for clients, family, and friends… or if you're the one who needs a bit of assistance.

We recommend installing Chrome Remote Desktop when you want to work with clients or service providers without the hassle of attending onsite.

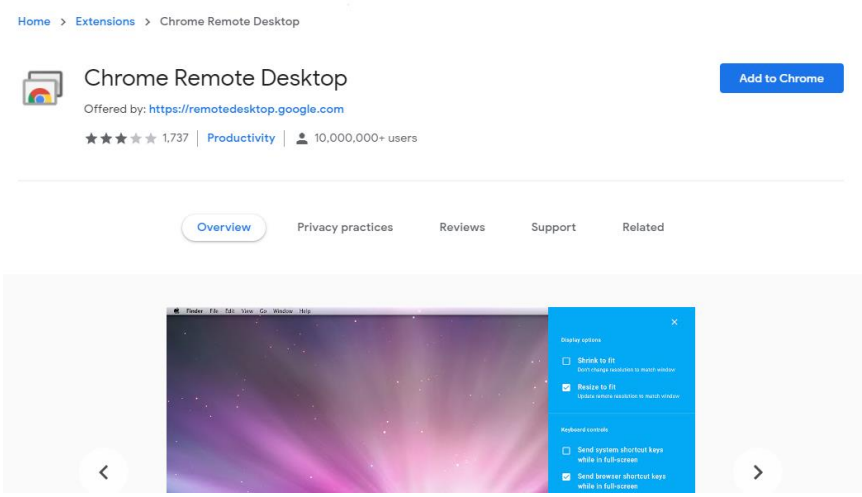
It's pretty easy to install, too! Here's a quick How To guide to get you started.



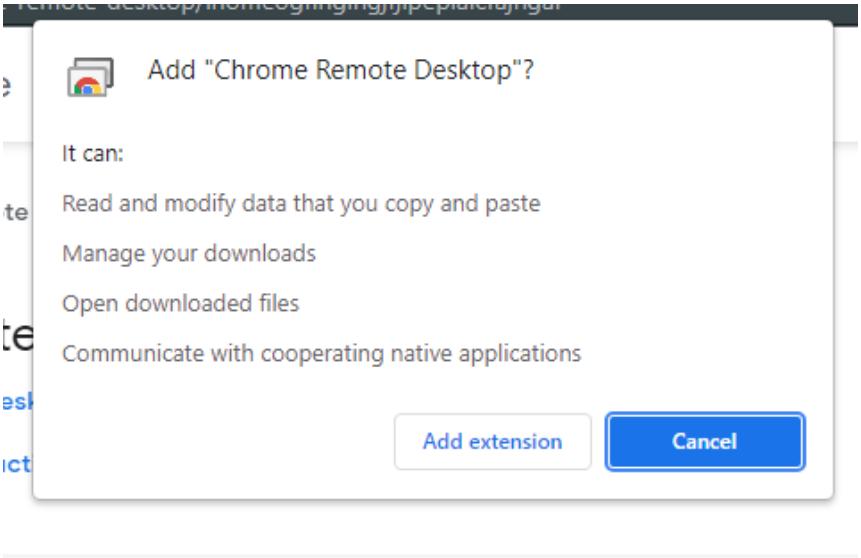
Go to https://remotedesktop.google.com/support/



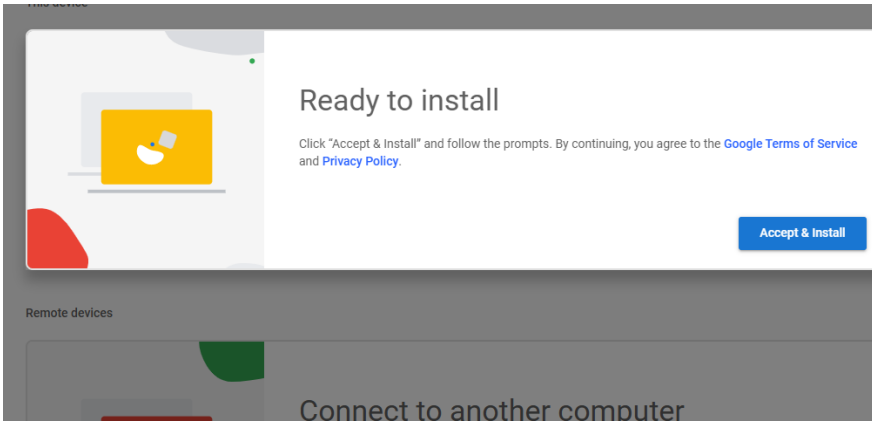
Click on "Share this Screen"



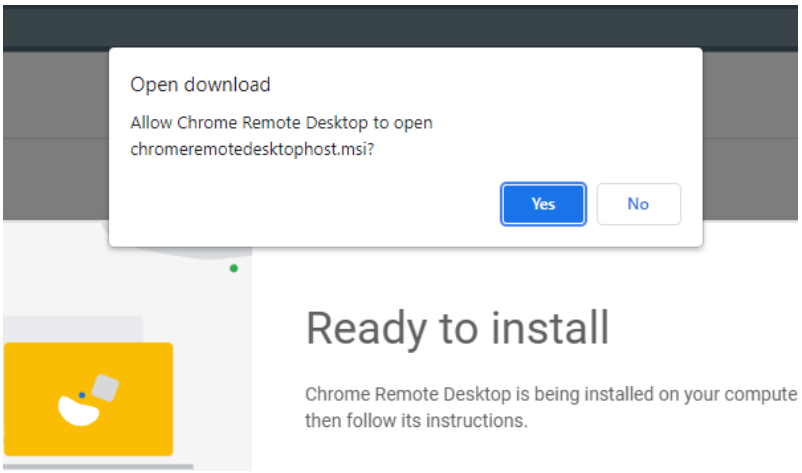
Click on "Add to Chrome"



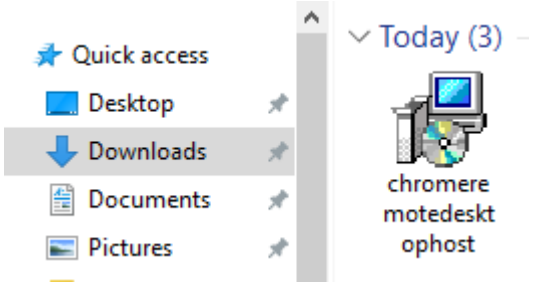
Confirm that you want to install Chrome Remote Desktop by click on “Add Extension”



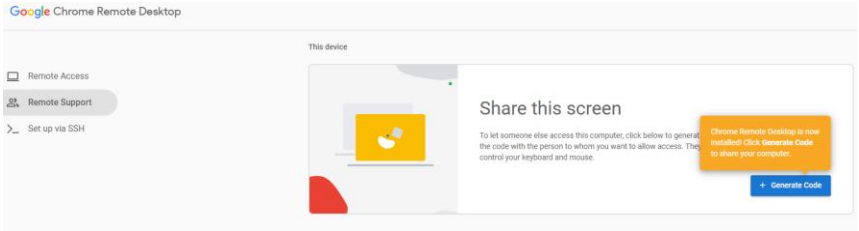
Click on “Accept & Install”



Click on “Yes” to Open Download



If the install confirmation box doesn’t open, or there is a delay, you can alternatively go to your Downloads folder in File Explorer and double click on “chromeremotedesktophost”



The Chrome Remote Desktop extension should be installed now. You can click on “Generate Code” to get a code that you can now send to the person you are authorising to connect to your computer. Using this code, they can help you remotely and see to any IT or digital support you require.
